

COMPLIANCE AND SECURITY MADE EASY

The pressure to demonstrate compliance with today's regulatory mandates is intense. The ability to detect threats, eliminate vulnerabilities, and manage log data is not only necessary for securing your network, it is also a regulatory mandate. As you strive to overcome your toughest PCI, SOX, HIPAA and GLBA challenges, tighter regulatory mandates, more stringent budgets and shrinking headcount only add to your stress.

Alert Logic is revolutionizing the way IT compliance and security solutions are designed, delivered, and utilized. As the security industry's only provider of Cloud-based log management, threat management, and IT compliance automation solutions, Alert Logic provides mid-sized organizations with the easiest and most affordable way to secure their networks and comply with critical policies and regulations.

Unlike appliance or software products, our Cloud-based platform delivers solutions on-demand, featuring rapid deployment, zero maintenance, and no hardware or software costs. With Alert Logic, you can manage compliance to policies and regulations and protect your network without having to break the bank.

Our reputation as a leading provider of Cloud-based IT compliance and security solutions is growing as our solutions gain prominence. Alert Logic's Threat Manager recently outperformed the competition in a review of security services, receiving a "Best Buy" Award from SC Magazine.

ALERT LOGIC KEY SOLUTION BENEFITS

Here's how Alert Logic can put you in complete control of your compliance and security efforts today:

- Easy to buy, deploy, use, and own with no software or hardware to purchase or maintain, no upfront capital investment required, all included in one convenient monthly fee
- Enables regulatory compliance by identifying both incidents and vulnerabilities that could impact compliance-relevant network assets, and by collecting, reviewing, and securely archiving log data
- Improves network security by identifying threats and vulnerabilities, and making historical log data available for analysis and forensics

"Alert Logic's Cloud-based offering provides a simple way to maintain visibility into our network security and enables us to address only those issues that represent real risk. The security expertise of the company, the maturity of their solution, and the ease of implementation and support made Alert Logic the clear choice for protecting our perimeter network from threats."

Stephen Bates
Assistant Vice-President
of IT Risk Management
Concentra, Inc.

Deploys in Minutes

Zero Maintenance

No Capital Investment

Alert Logic's log, threat, and IT compliance management solutions offer the easiest way to protect your network and comply with policies and regulations. Our solutions include:

Log Management leveraging our Cloud-based architecture to automatically collect, transmit, analyze, and archive log data from across your organization.

Threat Management combining intrusion protection and vulnerability management technology into a single integrated solution, offering both proactive and reactive protection from the latest threats.

Compliance Automation helping protect the availability, confidentiality, and integrity of your critical IT assets.

Log Management Made Easy

Government and industry mandates, such as PCI, SOX, HIPAA, and GLBA, require that you collect, regularly review and securely archive log data. Regular analysis and forensics can also be performed on the same log data to enhance overall security and availability.

However, manually reviewing even a single system or firewall log on a regular basis is complex and time-consuming—manually reviewing dozens, hundreds, or even thousands of distributed logs regularly is impossible. More than likely, you simply do not have the resources for such an intensive review. Another stumbling block: the hassle and cost of purchasing and managing a log management infrastructure, including terabytes of storage, can be staggering, especially for mid-sized organizations.

Why not manage your log data in a simple, efficient, even revolutionary new way? Alert Logic's Log Manager is the first Cloud-based log management solution available.

Log Manager automatically collects, transmits, analyzes, and archives log data from across your organization. Our in-network appliance collects, aggregates and compresses the data, the log data is then transmitted to our datacenter, then all subsequent processing, analysis, reporting, forensics, and archival are performed in our highly secure and redundant datacenters.

All solution capabilities are available from any browser. All configuration, tuning, maintenance, and solution upgrades are performed automatically and continuously. Simply put, Alert Logic Log Manager does it all for you so you can avoid the effort and cost associated with deploying and managing a log management system. With years of experience and hundreds of satisfied customers, the Alert Logic Cloud-based platform has radically simplified how organizations meet their compliance and security needs.

KEY BENEFITS

- Enables regulatory compliance with automated log data collection and due diligence review as well as immutable, redundant, and secure archival.
- Improves incident response and resolution for security, performance, and availability incidents via quick and easy browser-based access to all historical log data.
- Easy to buy, deploy, use, and own with no software or hardware to purchase or maintain, no upfront investment required, everything included in one convenient monthly fee.

Network Protection On-Demand

Despite your best efforts to provide a strong perimeter or endpoint defense, you know you're still vulnerable to security breaches. You want to improve network security and ensure compliance with policies and regulatory mandates, but how can you effectively protect your internal network from attack?

Alert Logic's Threat Manager delivers a critical layer of network defense. You can now guard against threats that easily bypass perimeter and endpoint defenses – constantly protecting your internal network from viruses, worms, and other threats brought in by roaming laptops, VPN connections, wireless access points, partner portals, and other supposedly “trusted” sources.

By combining intrusion protection and vulnerability management technology into a single integrated solution, Threat Manager offers both proactive and reactive protection from the latest threats. Its unique Cloud-based architecture means false alarms are eliminated. Instead, all of the alerts from our network appliance are fed directly into a centralized expert system hosted in our datacenter. Correlating the IDS alert data with vulnerability data and real-time threat trend information from all Alert Logic customers worldwide, we identify only valid security incidents that threaten your network – something a traditional standalone appliance simply cannot accomplish.

Alert Logic's Threat Manager is the easiest way to comply with regulations and protect your internal network from attack.

KEY BENEFITS

- Easy to buy, deploy, use, and own with no software or hardware to purchase or maintain, no upfront capital investment required, and everything included in one convenient monthly fee
- Improves network security by identifying threats and vulnerabilities that evade perimeter and endpoint defenses
- Enables regulatory compliance by identifying both incidents and vulnerabilities that could impact compliance-relevant network assets

"Compliance with the PCI Data Security Standard is an absolute must for our business. Part of our IT systems audit includes a requirement that we have security controls in place for our intrusion defense systems and that we can demonstrate that we monitor these systems around the clock. Using Alert Logic's managed threat defense solution in conjunction with our other security measures, helped us to demonstrate compliance with the PCI Data Security Standard."

Wyman Lewis
Director of Information Security
GSI Commerce

Cloud-based Architecture Offers Ease of Ownership

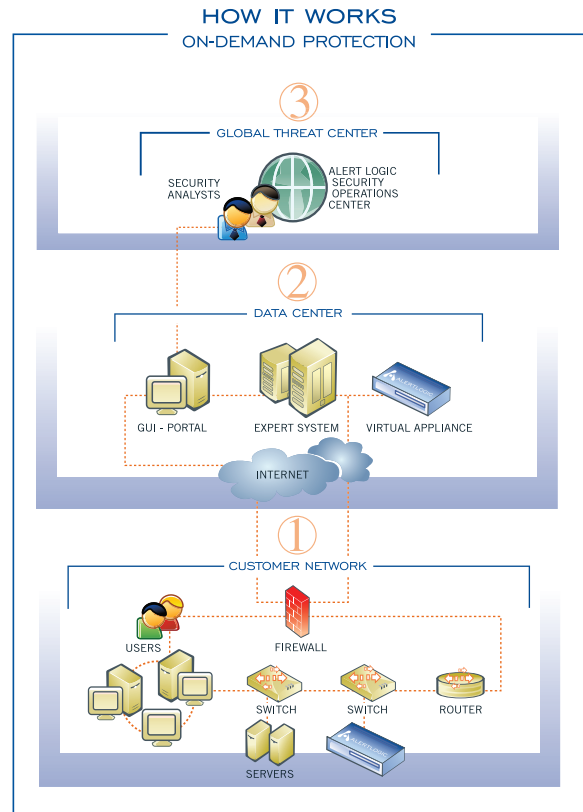

What makes our architecture so unique is its simplicity. You only need to plug in an Alert Logic network appliance—no additional software or hardware infrastructure is required. All other solution components—such as the management portal, reporting engine, historical data repository, and configuration data—reside in the Alert Logic datacenter, not on your network. Everything is at your fingertips via a Web browser. Put simply, you do not have to spend valuable resources deploying, configuring, maintaining, or upgrading our solution.

How do we deliver an unprecedented level of ease of ownership? Our Cloud-based platform enables this through our two basic components:

- The network appliance is the only component that resides on-premise and is responsible for collecting and forwarding log, threat, and vulnerability data to our datacenter for further processing
- The software-as-a-service component is hosted in our datacenter and is responsible for analyzing and securely archiving data from all Alert Logic customer appliances across the globe. This component also supplies all real-time and historical trending and reporting via the customer Web portal.

By simplifying the science of log management, you can easily search and analyze an endless sea of log data via any browser and store and backup an unlimited amount of log data without purchasing a single hard drive. By providing a critical layer of network defense, you can also guard against threats that easily bypass perimeter and endpoint defense.

The bottom line: With Alert Logic, you get easy and affordable IT compliance and security.

Only Alert Logic goes beyond traditional internal network security products, providing multiple layers of on-demand network protection and manageability.
